## Insights & upcoming events

The DASH Study was set up in 2001 with an emphasis on understanding the contributions of social structural influences on the development of ethnic inequalities in adolescent mental health. With the help of former Head master, Devon Hanson, the study recruited ~6500 adolescents aged 11–13 years old in the most ethnically diverse London boroughs. DASH remains a rare study worldwide to understand what contributes to ethnic differences in physical and mental health over the life course.
