Data-Driven Exploration

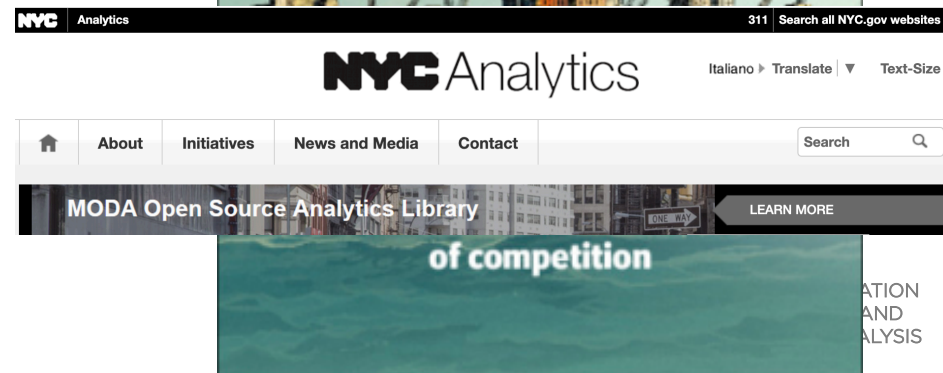

- Every scientific domain is moving toward data-driven exploration, this has led to great advances and discoveries
- Companies are capitalizing on data
- Government agencies uses data to operate efficiently, make policies, and inform decisions

Computing is free

Storage is free

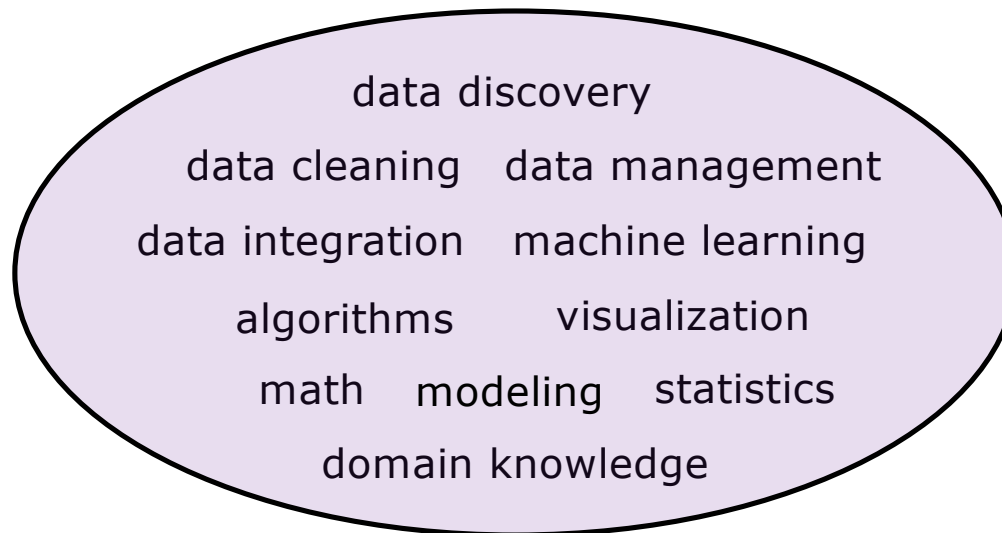

Data are abundant

The bottlenecks lie with people

Data-Driven Exploration: Challenges

- Data are vast and produced at unprecedented rates
 - Sources are broad, varied, unreliable, and difficult to integrate
- Complex computational processes are required to extract insight -- hard to assemble and require expertise in a wide range of topics and tools

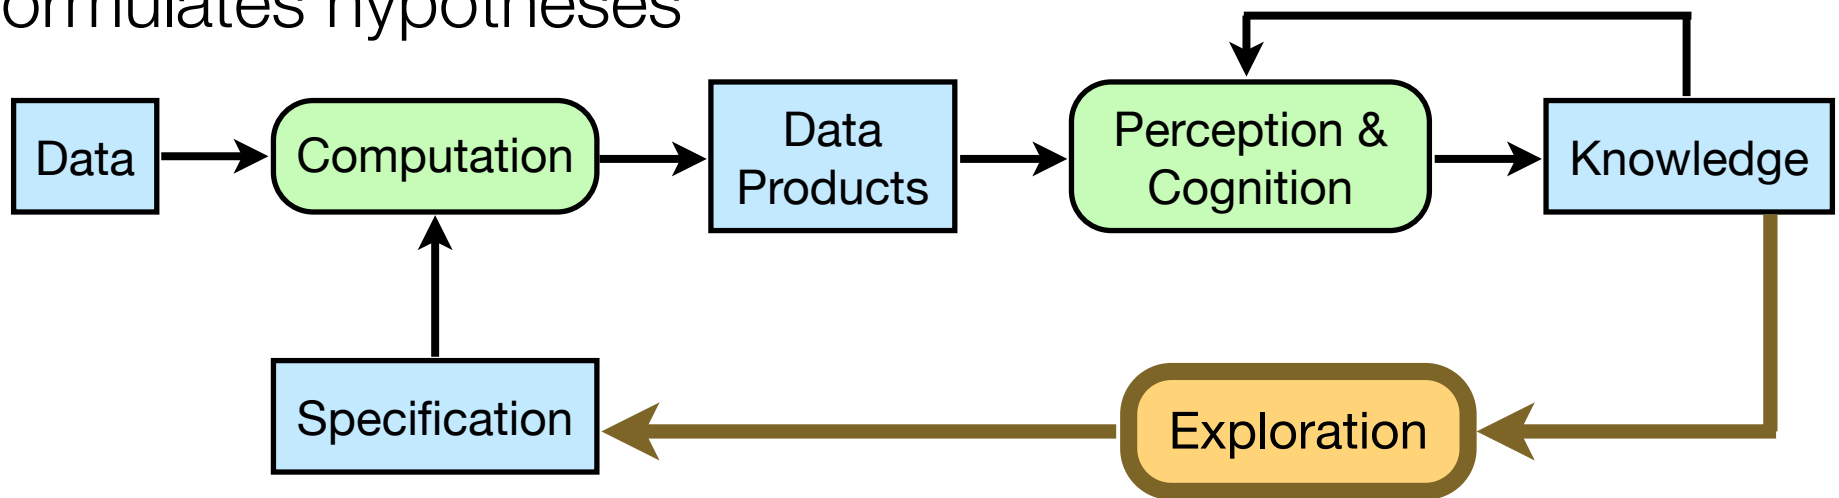

NYU

TANDON SCHOOL
OF ENGINEERING

Data-Driven Exploration: Challenges

- Diverse group of experts and data enthusiasts
- It is difficult for domain experts to explore data
 - Dependence on data scientists distances domain experts from the data
 - Analyses are mostly confirmatory (Tukey, 1977) – batch-oriented analysis hampers exploration
- Exploratory analyses are inherently iterative as one tests and formulates hypotheses

[Modified from Van Wijk, Vis 2005]

NYU

TANDON SCHOOL
OF ENGINEERING

Data-Driven Exploration: Challenges

- After many steps...
 - It is easy to get lost and not remember how a result was derived
 - Did I make any mistakes? Were there any problems with the data?
 - Processes can break or misbehave in unforeseen ways
 - Results can be hard to understand, interpret and trust

Incorrect conclusions can lead to bad decisions!

NYU

TANDON SCHOOL
OF ENGINEERING

My Research

- Empower a *wide range of users* to explore and obtain *trustworthy, actionable insights* from data
 - Reduce bottlenecks and make humans more effective
 - Support responsible exploration
- Develop methods that address problems at the different stages of the data lifecycle
- Combine methods from different computer science areas and solve real problems
- Build systems 😊

Urban Data

- Cities are the loci of economic activity
- 50% of the world population lives in cities, by 2050 the number will grow to 70%
- Growth leads to problems, e.g., transportation, environment and pollution, housing, infrastructure
- Good news: Lots of data being collected about many cities in the world

- Exploits the native support for drawing in GPUs
- Combines the aggregation with the join operation
- No Point-in-Polygon tests

Raster Join: Some Notes

- Rasterization can introduce false positives and false negatives
- Errors can be reduced: better approximate the polygon outline by increasing the screen resolution (reducing pixel size)
- Bounded Raster Join: specify acceptable error
 - Hausdorff distance between actual and approximate polygon

Take Away

- Need usability and performance for interactive exploration
 - Must combine techniques from Visualization, Computer Graphics, HCI, and data management [Doraiswamy et al., CG&A 2018; Chang et al., Dagstuhl 2018]
- GPUs can give you high-performance computing power on your laptop: You don't need big iron to analyze big data, you can do it on your **laptop!**
 - Spatial aggregation [Tzirita et al., pVLDB 2017], spatio-temporal keyword queries [Hoang-Vu et al., CIKM 2016], spatio-temporal selection queries [Doraiswamy et al., ICDE 2016]
 - And many others, e.g., [Bustos et al., ICCS 2006], [Zhang & Yu, BigSpatial 2012]

Can we abstract away this complexity?

Can we build a *unified* database engine
that leverages the GPU
to support a rich set of spatial queries?

NYU

TANDON SCHOOL
OF ENGINEERING

GPU-Friendly Data Model and Algebra

Key Idea: Use the computer graphics pipeline and translate spatial queries into drawing operations

- Canvas as uniform data representation for geometric objects
 - Points, lines, and polygons
 - Easy to represent on the GPU
- Algebra consists of set of composable operators
 - Optimized for the GPU
 - Operators work on canvas objects
 - Allows use across different spatial query types
 - Support common spatial queries, e.g., spatial queries such as selections, joins, aggregations, and knn queries.
- GPU hardware agnostic: graphics pipeline supported on all GPUs

GPU-Friendly Data Model and Algebra

Reproducibility and Trust

Provenance for data exploration and debugging

Provenance for Data-Driven Exploration

[Modified from Van Wijk, Vis 2005]

- Many things can go wrong...
- To assess validity and build trust in the results, we need detailed **provenance** of the **exploration process**
 - Reason about the steps followed
 - Reproduce and debug these steps

What to capture?

How to capture provenance?

Provenance Research and Systems

VisTrails: open-source system that supports data exploration through workflows: <https://github.com/VisTrails>

The image displays the VisTrails Builder interface for a workflow named 'weather_new.vt'. On the left, two workflow diagrams are shown. The top diagram includes steps: CSVReader, GetTemperature (ExtractColumn), MpiHistogram, MpiFigure, and MpiFigureCell, with a corresponding histogram visualization. The bottom diagram includes: CSVReader, GetTemperature (ExtractColumn), GetPrecipitation (ExtractColumn), MpiScatterplot, MpiFigure, and MpiFigureCell, with a corresponding scatter plot visualization. The main window shows a 'Version Tree View' with a hierarchical structure of nodes: 'basic histogram' (parent), 'precipitation', 'scatterplot', and 'fahrenheit' (children); 'precipitation', 'simulation', and 'other scatterplot' (children of 'scatterplot'); 'colors and title' (child of 'precipitation'); 'persistent intermediate' (child of 'simulation'); and 'persistent inputs' (child of 'persistent intermediate'). On the right, a 'Version Metadata' panel for the 'scatterplot' node shows: Tag: scatterplot, User: dakoop, Date: 22 Oct 2010 15:28:49, and Notes: 'In this workflow we also extract the precipitation data from the input file to build a scatter plot of precipitation against temperature values.' Below the metadata is a 'Visualization Preview' showing a scatter plot.

[Bavoil et al., IEEE Vis 2005, Freire et al., IPAW 2006; Koop et al., AOSA 2011]

Provenance Research and Systems

VisTrails: open-source system that supports data exploration through workflows: <https://github.com/VisTrails>

- New idea: provenance for the exploratory process – capture all steps

The image displays the VisTrails Builder interface for a workflow named 'weather_new.vt'. The interface includes a menu bar with options like New, Open, Save, Undo, Redo, Execute, Pipeline, History, Query, Exploration, Select, and Pan. A 'Version Tree View' shows a hierarchical structure of workflow versions, with 'scatterplot' highlighted. A 'Visualization Preview' window shows a scatter plot of precipitation against temperature. A 'Version Metadata' window provides details for the selected version, including the tag 'scatterplot', user 'dakoop', date '22 Oct 2010 15:28:49', and notes: 'In this workflow we also extract the precipitation data from the input file to build a scatter plot of precipitation against temperature values.'

The workflow diagram on the left shows a sequence of steps: CSVReader, GetTemperature (ExtractColumn), MpiHistogram, MpiFigure, MpiScatterplot, MpiFigure, and MpiFigureCell. The version tree shows a hierarchy starting from 'persistent inputs' and 'persistent intermediate' leading to 'simulation', which then branches into 'precipitation', 'scatterplot', and 'fahrenheit'. The 'scatterplot' node further branches into 'colors and title' and 'other scatterplot'.

[Bavoil et al., IEEE Vis 2005, Freire et al., IPAW 2006; Koop et al., AOSA 2011]

NYU

TANDON SCHOOL
OF ENGINEERING

Change-Based Provenance: Summary

- General: Works with any system that has undo/redo
- Uniformly captures data and workflow provenance
 - Data provenance: where does a specific data product come from?
 - Workflow evolution: how has workflow structure changed over time?
- Results can be reproduced
- Provenance can be (re-)used to streamline exploration
 - Support for reflective reasoning, collaboration, recommendations, and many more [Freire & Silva, CISE 2012; Santos et al., IPAW 2012; Koop et al., ICCS, 2011; Silva et al., CGF 2011; Bauer et al., JSTAT 2011; Koop et al., SSDBM 2010; Santos et al., IEEE Vis 2009; Koop et al., IEEE TVCG 2008]

NYU

TANDON SCHOOL
OF ENGINEERING

[Freire et al, IPAW 2006]

Provenance Beyond Reproducibility

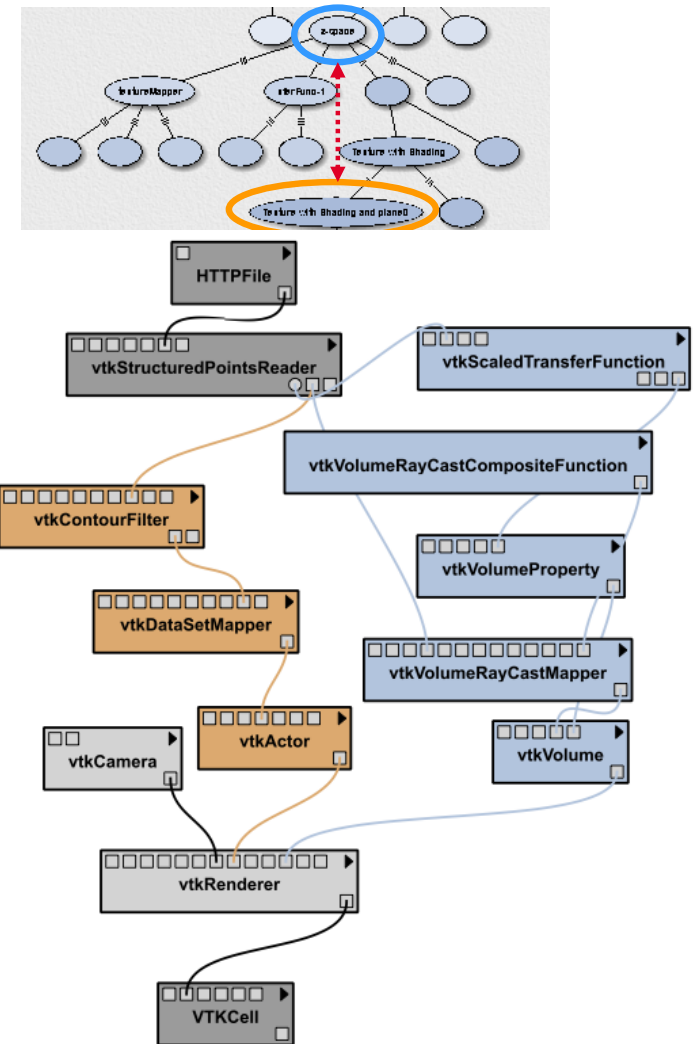

- Support for reflective reasoning
- Ability to compare data products

$$vt_1 = X_j \circ X_{j-1} \circ \dots \circ X_1 \circ \emptyset$$

$$vt_2 = X_j \circ X_{j-1} \circ \dots \circ X_1 \circ \emptyset$$

$$vt_1 - vt_2 = \{X_j, X_{j-1}, \dots, X_1, \emptyset\}$$

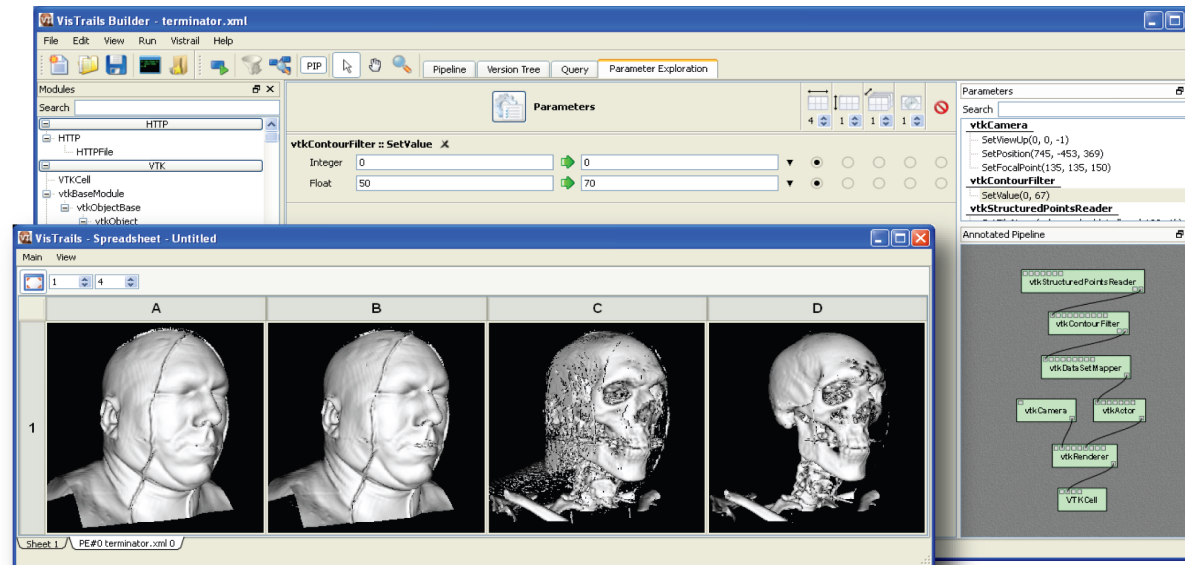

$$- \{X_j, X_{j-1}, \dots, X_1, \emptyset\}$$

Provenance Beyond Reproducibility

- Support for reflective reasoning
- Ability to compare data products
- Explore parameter spaces and compare results
 - Also explore alternative computations

$(setParameter(id_n, value_n) \circ \dots \circ (setParameter(id_1, value_1) \circ v_t)$

$(addModule(id_i, \dots) \circ (deleteModule(id_i) \circ v_1)$

...

$(addModule(id_i, \dots) \circ (deleteModule(id_i) \circ v_n)$

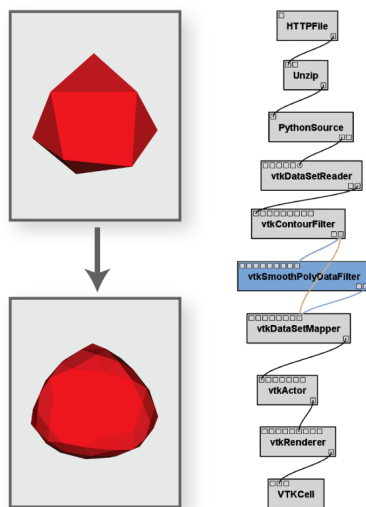

NYU

TANDON SCHOOL
OF ENGINEERING

Provenance Beyond Reproducibility

- Support for reflective reasoning
- Ability to compare data products
- Explore parameter spaces and compare results
 - Also explore alternative computations
- Knowledge re-use: refine analyses by analogy

Analogy Template

Automatically constructed visualizations

VisComplete: Workflow Recommendations

- Mine provenance collection: Identify graph fragments that co-occur in a collection of workflows
- Predict sets of likely workflow additions to a given partial workflow
- Similar to a Web browser suggesting URL completions

Provenance Beyond Reproducibility

- Support for reflective reasoning
- Ability to compare data products
- Explore parameter spaces and compare results

Same ideas can be applied to data science pipelines

Analogy Template

Automatically constructed visualizations

Reproducibility & Trust

- Reproducibility is a means to an end: necessary to verify and build trust in results
- And to debug computational pipelines!

<https://dingyuliang.me/big-data-pipeline-open-source-technologies/>

NYU

TANDON SCHOOL
OF ENGINEERING

Debugging Pipelines

- Problem: Given a computational pipeline, the provenance of previously-run instances, and an evaluation function that determines the success/failure of an execution, identify the root cause of failures

Execution Provenance

Instance	Data	Library	Estimator	Score	Evaluation
CP ₁	Iris	1.0	Logistic regression	0.9	Success
CP ₂	Digits	1.0	Decision tree	0.8	Success
CP ₃	Iris	2.0	Gradient boosting	0.2	Failure
CP ₄	Digits	2.0	Gradient boosting	0.3	Failure
CP ₅	Iris	1.0	Decision tree	0.7	Success
CP ₆	Images	1.0	Gradient boosting	0.9	Success

But are these the actual causes of failure?

Finding Root Causes for Failures

- By executing new configurations with different parameter-value combinations, we formulate and test hypotheses
- Challenge: How to select the new configurations?

Instance	Data	Library	Estimator	Score	Evaluation
CP ₁	Iris	1.0	Logistic regression	0.9	Success
CP ₂	Digits	1.0	Decision tree	0.8	Success
CP ₃	Iris	2.0	Gradient boosting	0.2	Failure
CP ₄	Digits	2.0	Gradient boosting	0.3	Failure
CP ₅	Iris	1.0	Decision tree	0.7	Success
CP ₆	Images	1.0	Gradient boosting	0.9	Success
CP ₇	Iris	1.0	Gradient boosting	0.7	Success

BugDoc: Debugging Pipelines

- Black-box approach to find root causes for problems in computational pipelines
- Leverages the ability to re-execute a given pipeline and iteratively create instances to test parameter-value combinations unseen in provenance
- “Shortcut” algorithm finds root causes in time **linear** wrt the number of parameters
- Debugging Decision Trees capture complex combinations of partial configurations as root causes
- Attains high precision and recall

BugDoc in Action at a Major Software Company

- BugDoc integrated to a proprietary Python API for a workflow system – workflows can be uploaded and executed
- Developed a parser to extract parameters and values from workflow
- BugDoc identified problematic configurations in computation scripts and input data files

NYU

TANDON SCHOOL
OF ENGINEERING

Take Away

- Provenance and reproducibility are essential to build trust in and *explain* results produced by computational processes
- Not everybody produces reproducible results and follows reproducibility best practices...
- But reproducibility is not just important for science, it is also good for you!
 - Making your experiment reproducible forces you to document the execution pathways, this, in turn, helps newcomers to your group;
 - There exists preliminary evidence that reproducibility increases *impact*, *visibility* [Vandewalle et al. 2009] and *research quality* [Begley and Ellis 2012],
 - Helps you find problems in your computations, e.g., bugs, assess fairness

<https://sites.nationalacademies.org/sites/reproducibility-in-science>

Conclusions

- To **empower domain experts**, need new methods and usable tools that
 - Enable users to **interactively explore *large data***
 - Help **assess the quality and debug results**
- Need interdisciplinary teams and collaboration with domain experts
 - Visualization, data management, computational topology, computer graphics, statistics
 - Virtuous cycle: interdisciplinary research that derives new problems and solutions for multiple areas
- Computer science and data science communities are well positioned to have tremendous practical impact
