How satisfied are people with health services?

Satisfaction levels vary across social, economic and geographic characteristics

Sandhya Venkateswaran

atisfaction with public services can influence political outcomes; and low satisfaction can sometimes be a catalyst for change. Low levels of satisfaction can either spur political leaders to initiative public policy reform or they can lead to action by citizens, who either vote for political leaders who promise to make services better or seek private alternatives instead.

Therefore, understanding citizen satisfaction with the provision of health services has important consequences, particularly in India, where citizens use both public and private services. Table 1 shows the overall level of satisfaction with the health system in India, irrespective of public or private access. Over a third of respondents are fully satisfied with the overall healthcare system, and nearly half of all respondents are fully satisfied with the treatment

Table 1: Satisfaction with health services

	Overall healthcare system*	Treatment in hospital last visited**
Fully satisfied	37	48
Somewhat satisfied	42	35
Somewhat dissatisfied	10	3
Fully dissatisfied	7	2
No response	3	11

Note: All figures are in percentage

Question asked:

*In general, would you say that you are satisfied or dissatisfied with the overall healthcare system in India?

* Were you mostly satisfied or dissatisfied with the treatment provided at that hospital or dispensary?

they received in the hospital the last time they had to visit. Although relatively few people express dissatisfaction, the majority are not fully satisfied.

However, citizens are not a homogenous community and levels of satisfaction vary across social, economic and geographic characteristics. Differences are most pronounced in terms of economic status, with rich people expressing the most satisfaction at 45% and the poorest expressing the least at 32%. Thus, those with the least capacity to negotiate the healthcare system are the least satisfied. Rural-urban divides are also visible. with levels of satisfaction amongst rural residents higher than amongst urban residents.

However, there are no meaningful differences in satisfaction between people who use public services and people who use private services. There are also no

differences between men and women. Age demographics also do not suggest significant differentials. It is only citizens in the middle age group (46-55 years) who reveal a higher level of satisfaction. With the exception of Hindu Adivasis, caste and religious identities also do not vary widely in their levels of satisfaction.

Satisfaction levels also

vary by State. Satisfaction is highest in Gujarat and lowest in Tamil Nadu and Uttar Pradesh. Part of these differences may reflect voters' experiences of using health services, but part of them may also reflect their expectations about what the service should deliver. In this respect it is important to track how these levels vary over time in response to what governments do to see whether voters' expectations can be met (or even exceeded).

Methodology of the study

The findings presented here are from a survey conducted among 1,522 citizens across five States - Bihar, Gujarat, Rajasthan, Tamil Nadu and Uttar Pradesh – between March and April 2022. This is a collaborative study conducted by Lokniti-Centre for the Study of Developing Societies (CSDS) with King's India Institute, Royal Holloway (University of London) and the Centre for Social and Economic **Progress** (CSEP). The survey received funding from the British Academy small grant SRG21\211431. These five States were

selected because they represent a range of overall health outcomes, a public/ private healthcare mix, and are governed by different political parties. In each State, three districts were selected for sampling based on their performance on various health indicators. From each district four locations - two villages, one town, and one district headquarters were selected. From each location, the enumerators were instructed to interview 25 respondents randomly. In total, 100 interviews were conducted

per district which accounted for 300 interviews from each State. A random sampling method was used for selecting a household and quota sampling was used for selecting a respondent. For mapping out the profile of respondents, we provided a sheet with a pre-assigned quota of age

and gender. The interviews were conducted face to face at people's homes by specially trained field investigators, mostly students from various colleges and universities. A specially designed App (SurveyCTO) was used for the data collection. The questionnaire for the survey was translated into Tamil and Gujarati for Tamil Nadu and Gujarat, respectively. In Bihar, Rajasthan and Uttar Pradesh, a Hindi questionnaire was used. Each interview took 20-25 minutes to be completed.

Rakesh Ranjan in Bihar,

Sanjay Lodha in Rajasthan,

Gladston Xavier in Tamil Nadu and Shashikant Pandey in Uttar Pradesh coordinated the study. The Lokniti team coordinated and analysed the data constituted of Jyoti Mishra, Vibha Attri, Himanshu Kapoor, Rishikesh Yadav, Himanshu Bhattacharya, Devesh Kumar, Aa-

Kumar Singh. The study was directed by Sanjay Kumar, Suhas Palshikar and Sandeep Shastri.

Does contact with a service make people more or less satisfied?

Devesh Kumar & Suhas Palshikar

The level of voter satisfaction with public health services is a crucial indicator of the strength of a country's healthcare system. The quality of interaction between voters and healthcare services can significantly influence voter satisfaction. As public health systems are primarily funded by the government, political support for public healthcare policies is crucial. If the public is not satisfied with the healthcare services, they are more likely to withdraw their support for political leaders and policies that support public healthcare. This could lead to reduced funding for public health services, which would impact their quality and accessibility.

Our survey found that close to a quarter of people have availed of popular health schemes, including Avushman Bharat (28%), State Health Insurance Programmes (26%), Janani Shishu Suraksha Karyakaram or JSKK (24%) and Janani Suraksha Yojna or JSY (20%), while close to half have benefited from Mission Indradhanush (48%). It is interesting to note that close to half the people never benefited from these schemes (barring Mission Indradhanush). Health schemes aimed at providing better health services for women and children had the lowest outreach (Table 1).

Overall, people who benefited from schemes were more likely to be satisfied than those who had not. Intriguingly, substantial numbers were satisfied with the schemes despite not having benefited from them (Table 2).

The proportion of satisfaction of voters was also formed by the quality and duration of the service provided at hospitals. The people who had to wait for less than an hour for medical treatment tended to be more satisfied than those who waited for more than two hours (63% and 36%). In general, the level of being 'fully satisfied' decreased with increase in waiting time. This also suggests that higher proportion of satisfaction is also indicative of greater degree of access to outpatient ser-

vices that require less time

Moreover, voter satisfaction is also related to the perception of whether the sened in the last few years

conditions of hospitals have improved or wor-

(Table 4).

The findings suggest

that judgments on whether things have got better or not are more important than the absolute level of service provided.

Do voters care about health?

<u>Vibha Attri</u> & Aaliyia Malik

In India, the issues that occupy a crucial space in electoral campaigns have traditionally revolved around the subject of development. Past Lokniti-CSDS data show that the majority of voters identify development, inflation and unemployment as the main voting issues during elections, and relatively few people mention the provision of health services even after the pandemic.

However, this does not mean that voters do not care about health at all. We asked voters about the various issues that they thought were important for improving the level of development in their area. While 31% report jobs and employment to be the most important, health is the se-

ment (37%), but once again, education and health both emerge as issues of concern. (Table 2). This is particularly the case among older voters who are more concerned about health than younger people (29% versus 19%). By contrast younger people are more concerned about employment (46% versus 30%).

Health is also an issue

that is of some electoral importance. Overall, more than half the respondents said health facilities affect their vote choice 'to a great extent' or 'to some extent' at local (56%). (61%) and national elections (57%) (Table 3).

Vibha Attri and Aaliyia Malik are researchers at Lokniti-CSDS

Does health impact voting decisions?

Oliver Heath & Louise Tillin

The famous adage 'It's the economy, stupid' has been used to explain election outcomes. But other aspects of government performance receive less attention. It is often thought that Indian voters do not pay attention to health as a political issue. The Lokniti-CSDS survey data allows us to assess the extent to which voters do hold the government to account on this issue.

We asked voters to say whether different services have got better, stayed the same, or got worse over the past five years. Most voters report that government hospitals (52%) have got better, though a sizeable number say that they have stayed the same (31%) or got worse (12%). Public evaluations of health services are therefore more positive than evaluations of employment opportunities, which only 14% think have improved; but behind education and electricity which 57% and 66% think have improved (Table 1).

Voters are more likely to attribute responsibility for running government hospitals to their State government than to the Central government (37% compared to 14%). We, therefore, look first at whether Table 1: Evaluations of service delivery

	Improved	Remained the same	Got worse	Can't say
Employment opportunities	14	30	48	8
Government hospitals	52	31	12	5
Government schools	57	26	11	6
Supply of drinking water	51	29	17	3
Supply of electricity	66	21	10	3

Note: All figures are in percentage Question asked: During the last five years, has delivery of these services improved or deteriorated in your area? List of items are given in the first Table 2: Performance evaluations and support for Chief Minister's party

support for efficient ministers party				
		Incumbent CM's party	Other parties

Note: All figures are in percentage

responsible for the provision of health services. Table 3 shows that performance evaluations are less likely to impact whether or not people vote for the BJP in general elections, particularly in States where the

BJP is not in power at the State level. In States with a BJP Chief Minister (Gujarat and U.P.), people who said hospitals had got better are more likely to vote for the BJP in general elections than people who said that

they had stayed the same or got worse. But in States where the Chief Minister is not from the BJP (Bihar, Rajasthan, and T.N.), people who said hospitals had improved are less likely to vote for the BJP in the general elections.

The findings show that State-level governments can be held to account for the quality of health services they provide. This suggests that there is electoral value for them to do more to strengthen and claim credit for health system performance.
